Outline

- On-Page
- Off-Page

On-Page

- This is the **technique** of *improving individual webpages* so as **to rank higher** and secure dynamically huge traffic by web crawlers.
- On-page implies **both** the *available content* and *HTML source code* of a page that can be developed, as opposed to **off-page SEO** which proposes *links* and *related links*.

On-Page

- Keywords
- Title
- Description
- Contents (H1 → H6)
- sitemap.xml
- robots.txt

Keyword Significance

- **Keywords** are the *basic* and *most important* **SEO tools** for any web browser as they help the search queries to be materialized and actualized for search queries.
- So, *choosing the right keyword* is the **main activity** for redesigning SEO operation.
- If a web developer cannot design good keywords, then SEO will be very difficult to operate as a lot of money and time will go down the drain.

Keyword Selection

- For a dynamic web search, the visitor will always want to have a **two-word-** or **three-word-based keyword** by which the search queries can be easily pop up and the information can be accessed easily.
- The vital thing you need to do is to **prepare keywords** that **portray the content of your site**.

Keyword Selection

- Ideally, the marketer knows the customers well.
- So, the **search queries** and **keywords** of potentiality can be more suitably suggested *by the marketer to the developer* and *should be given priority*.

Keyword Selection

- When picking the **suitable keywords** to update, you need **to consider** the ordinary *month-to-month number of visits* or *queries* as well as the congruity of these specific keywords to the website.
- Keywords show *how much* the website takes the *point of view of visitors* or the *perception of the information search process*.

Keyword Numbers

- Once you **have found** the **keyword** which depicts and represents the core theme of the website and expectedly gives the maximum result in attracting visitors, then it is the **duty of the developer** to make the website **abundant** with similar words.
- But **excessive keywords** will make the website **cluttered**.

Keyword Numbers

- However, the *optimized* number of keywords will give **3-7%** more importance than a lesser number.
- So, it is important to have *good keywords* in the **content**.
- It is good to keep **five** to **ten keywords** on a page so that it will be optimized well.

Keyword in Special Places

- Keywords in *optimized numbers* **increase the quality** additionally.
- If keywords are in the page title, the headings, and the principle areas then it is good to have **a link** with *underlying content*.
- If you have a comparable special keyword as your competitors, yet you have that word in the URL, this will help the website fantastically in improving the rank.

Keyword in URLs

- As per the rule of thumb of SEO, we should have **five keywords** in the URL of the site, as otherwise it will be difficult to remember them.
- So, there must be some balance in it.

Keyword in URLs

- Additionally, pay a little attention toward whether you know how to consider a few *extraordinary website names*, which are already taken by others.
- So, **a tool** which helps you find a URL name will be valuable.
- *File names* and *directory names* are similarly noteworthy as they are easy and less complex to remember.

Keyword in Webpage Titles

- The webpage title is exceptionally accepted as the content of the **<title>** tag for the most part appears in most web data (searching in Google).
- For SEO purposes, **don't leave <title> empty.**

Keyword in Webpage Heading

- Normally headings of webpages are *differentiated* from subtitles from a dynamic website.
- There is also **no limitation** with the *length of headings* as there is no restriction on page number.
- It is advisable to have at least **seven** to **eight** *keywords* in a heading, or it may spread to **two** to **three** *lines* which should be avoided.
- If we keep keywords continuously in two to three lines then it **will not be good**.

Domain

- Website **names** are the **most important** thing for getting clicks on the Internet.
- They incorporate three fragments: **A top-level domain** (at times called an expansion or suffix), **a domain name** (or IP address), and a discretionary **subdomain**.

Domain

- In the URL `http://www.xxxyyyyzzz.com`,
 - `http://` → represents the **protocol**,
 - `www.` → denotes the subdomain,
 - `xxxyyyyzzz` → domain name, and
 - `.com` → the top-level domain.
- Both the **domain name** and **top-level domain** combined represent the **root domain**.

Domain Name Should Be Brandable

- Always the domain name should be such that it helps in creating a **brand** and **identifiable features**.
- **Hyphens** and **numbers** are a certifiable issue since they don't make something sound like a brand, nonexclusive or impossible to miss.

Make It Short

- This implies that the domain name should be such that it will have *minimum words* and be *identifiable*.
- Short domain names make things look very simple and yet powerfully placed in the subconscious minds of consumers.
- So, the rule is **keep it short and simple**.

Names interfere with Similar Organiz.

- It is *unlawful* to use *similar words* or *keywords* or spell-alike words for your websites which are in direct competition with the competitors.
- One **should avoid these names** as they can attract legal disputes and a bad reputation in the market as the competitor can file a lawsuit.

Make It Intuitive

- If your **domain name** is *easily intuitive* for all who easily interact with you, then it is better to have that name as your domain name.
- It can give you the *advantage* of quick **reliability** and **relatability among the visitors**.

Hosting

- This is the most important stage after arranging and building up a website for the Internet.
- **Who** will be facilitated?
- Would it be advisable for you to go for SEO?
- Web facilitation, or hosting as it is popularly called, isn't simply identified with the cost and highlights of the web facilitating server.

Hosting

- Website proprietors who are distantly located think about different variables, for example, website design and subsequent improvement. Does picking a host server have any effect on SERP or not?

URL Restructuring

- For maintaining the correct structure of your URLs is likewise significant.
- Search engines face issues while ordering in dynamic websites.
- Apache is the most prevalent web server and modifies the module to change itself to dynamic long URLs for search engines, and most facilitating organizations offer it.

HTML and XML Sitemap

- When you are finished making your sitemap, it is prescribed that you **submit it with Google webmaster tool** with the goal that **Google can crawl your sitemaps**.
- One of the primary contrasts between HTML and XML sitemap, is in **how Google views the site**.

URL Structuring

- Web optimization and well-disposed URLs have always been in focus for SEO.
- From the quantity of organizers to the consideration of the essential specific keywords, proficient SEOs have investigated various mixed approaches for the ideal URL structure.
- It is described below how to structure or formulate URLs.

URL Structuring

- **Keywords inclusion** is something to be thankful for.
- If the fundamental keyword is included naturally with the content, then it will draw good response.
- Benefits are as follows:
 1. It will come up in the status bar if a browser clicks on a linking website that comes up as a picture.
 2. Another huge preferred method is that web crawler visitors give a great deal of consideration to significant catch words in the web index SERP which draws greater traffic.

URL Structuring

- The *most effective* **URL** is that which the visitors can use easily.
- Web index is the not the most important thing for a clean URL, since **visitors** generally *go for* **content** and click on long items to read.

URL Structuring

- Web search tools don't especially have any issue with longer URLs.
- In this way, at the end of the day, URL length doesn't directly influence the web index and rankings.

URL Structuring

- **Short URLs** are generally preferred as they are simple to use.
- Besides, due to the **limitations** of *social media* like Twitter, **shorter URLs are much simpler to share** over the internet.
- As a rule of thumb, if the URL of your blog entry is ***under 50 characters***, you don't need to stress over it.

URL Structuring

- If it is *longer than 100 characters*, at that point you should *rework* it and *make it easier to understand*.
- The URLs of articles positioned on **Google's #1** page contain an **average of 37 characters**.

Matching URL to Title of Webpage

- It is viewed as an *excellent practice* to **coordinate** the **URL** with the **title** of the post – in any way possible.
- If title or content of the page is to some degree *not quite the same* as the catch words present in the URL, it might prompt a “bounce”.

Matching URL to Title of Webpage

- In a *perfect world*, you should **coordinate** the title and URL *as much as possible*.
- *Stop words*, like **and**, **or**, at the same time, **the**, **an**, and so on, are **not important** to incorporate into the URL.

Matching URL to Title of Webpage

- There is *no restriction* for inclusion of these words in the URL; however, they can frequently **make a URL irrationally long**.
- One of our objectives is to *consistently* **make the URL short, basic, and decipherable**.
- **Keeping away** from such *stop words* can enable you to accomplish that objective of effortlessness.

Case Sensitivity

- `www.abc.com/xyz` ~ `www.abc.com/XYZ`.

Picture Names

- The **alt** traits of these pictures *should not be neglected* as **alt tags** and **title tags** fortify the message for web index.
- This improves the ranking. The expression “**alt tag**” is generally utilized for restricting what’s really an alt trait on an img tag.
- For any picture on the website, the **alt tag** ought to *depict what’s on it.*

Picture Names

- When a picture is used without any logic only to create a background, then it *ought to be* in your CSS and not in your HTML.
- If you truly can't transform it, *give it a vacant alt* characteristic, as so: ``.

Picture Names

- The *unfilled* **alt trait** ensures that screen browsers skirt the picture, alt content, and SEO.
- Google gives generally *high esteem* to **alt writings** to *figure out* **what is in the picture**, yet in addition to decide the subject of the encompassing content.

Picture Names

- This **doesn't mean** that you will *spam the keyword* into each **alt tag**.
- The only thing that is required is to have a calibrated a *good related image* for the posts where the website will have all the content around the centered keyword.
- **The rule of thumb** is that *if a keyword in the picture helps in identifying something*, then **include the alt tag**.

Meta Tags

- These are an incredible *route* for webmasters to give data about the websites to search engines.
- They give data for all browsers in all frameworks that they comprehend.
- They are added to the **<head>** area of your HTML page.

Google Uses Meta Tags for Ranking

- Some web crawlers once hoped to use concealed HTML tags like meta tags *for requesting search engines* in internet search results pages;
- However most search engines (in 2019) have developed past this, and Google surely has.
- Google has gone on record saying that it doesn't utilize few meta tags when positioning a page (in a positive way) and tests during the time have unquestionably appeared to affirm this.

Meta Tag Types

- Company name `<meta name="author" content="Author name(s)">`.
- In the event that there are numerous creators for a page, separate them by commas.
- 1. `<title>The Title of the Page</title>`
- 2. `<meta name="description" content="Description of page"/>`
- 3. `<meta name="keywords" content="Keywords identified with page"/>`

Optional Meta Tags

- 1. **<meta** name="geo. position"
content="latitude; longitude">
- 2. **<meta** name="geo. place name"
content="Place Name"
- 3. **<meta** name="geo. region" content="Country
Subdivision Code">
- 4. **<meta** name="robots" content="noindex,
nofollow"/>
- 5. **<meta** name="revisit-after"
content="period">

Detailed Description

- 1. The **title tag** is for use on each page on the site. This ought to portray the content of every one-of-a-kind page and incorporate keywords if relevant.
- 2. The **meta description tag** is where you can incorporate a synopsis of the page content.
- 3. The **meta keyword tag** incorporates keywords significant to your site and the particular page.

Detailed Description

- 4. The **geotags** are area-specific tags which can sit on each page on your site. These are for use if you have a physical area that is significant for your business, for instance a café. They can likewise be utilized for organizations that have stores all through the nation, with geotags doled out to any similar page for every individual area.
- 5. The **robots** label advises the search engine crawlers on how to treat the pages of your site; Noindex will advise the web crawlers not to record that page. Noindex will let them know not to pursue any of the connections on the page.
- 6. The **revisit** after label advises the web crawlers how frequently to return to and re-crawl the site.

For Title, Keywords, Description

- The **title tag** is significant and ought to show up on each page of the site.
- This ought to mirror the *content of the page* and incorporate a *couple of keywords* important to the page.
- The search engines find the *keywords* **inside** the *title* and *description* that matches with the result.
- Each page ought to have **individual** title tags.

For Title, Keywords, Description

- The **meta description** ought to be *expressive* and furthermore *identify with what shows up on-page*.
- It must contain keywords where important and be confined to **155 characters** (any extra characters will be cut off inside the web crawler results).
- The meta keyword tag normally incorporates a couple of keywords significant to each page. This tag is presently to a great extent repetitive and is probably going to be overlooked by the web crawlers. In the early long periods of SEO, this tag was to a great extent mishandled by stuffing in loads of keywords, now and then inconsequential to the page content. To forestall this training, web search tools started disregarding these to counteract any control of the rankings. Whenever

For Title, Keywords, Description

- The **meta keyword** tag normally incorporates a *couple of keywords* **significant to each page**.
- This tag is presently to a great extent *repetitive* and is probably going to be overlooked by the web crawlers.

Concept of Off-Page

- This deals with those activities where **external links** with *different partners* are established for improvement of search engine results page (SERP).
- These techniques deal with more complexity and specially with past web composition where listing or ranking can be done with establishing backlinks.

Concept of Off-Page

- Web crawlers use on-page SEO for depicting the information.
- Off-page techniques act on the principle of **how the external world looks to the website** from other links through web-based networking media (Facebook likes, tweets, Pins, and so forth.).

Off-Page SEO

- 1. Increasing the ranking.
- 2. Increasing page ranking.

Backlink

- This is one of the most used cult words in SEO development by worldwide developers.
- Backlinks simply connect site pages.
- Blogging is nowadays used as an enhancer of backlinks.
- Previously blogging was used to position the web pages as with lot of backlinks which propel the ranking and positioning across all search engines

Backlink

- This is one of the most used cult words in SEO development by worldwide developers.
- Backlinks simply connect site pages.
- Blogging is nowadays used as an enhancer of backlinks.
- Previously blogging was used to position the web pages as with lot of backlinks which propel the ranking and positioning across all search engines

Terms Associated with Backlinks

- 1. **Linking juice** or **interface juice**: At the time of connecting two sites or blogs with the landing page, some juice or information is passed. This information is used to position the article and improve space authorization.
- 2. **Link of nofollow**: When a website links to another website, but the link has a nofollow tag, that link does not pass link juice. Nofollow links are not useful concerning the ranking of a page as they do not contribute anything. In general, a webmaster uses the nofollow tag when he/she is linking out to an unreliable site.
- 3. **Link of follow-up**: Those links, at the time of connecting two websites or blogs, which are important for future linking are called follow-up links.

Terms Associated with Backlinks

- 4. **Root domain links**: Backlinks which come from an exceptional area even if the website is connected or not to multiple sites. It is the one and only connection of root space.
- 5. **Links of low quality**: These are links from automated websites, digitally harvested sites, spam. These play havoc if followed in the off-page SEO.
- 6. **Links of internal connections**: Those links which move within a small space internally are called inward links used for interlinking.
- 7. **Anchor text**: Hyperlinked text in the content as a grappled backlink which helps in the ranking of keywords.

Off-Page

- Marketing articles
- Social networks
- Supporting websites (Same content)
- Forums
